

Programming Challenge (3 Hours)

Design XD File:

<https://xd.adobe.com/view/201e2828-881f-4c66-9169-13094de743a7-754d/>

- Create login and register page
- Manage validation in login and registration page
- User registration details store using local database
- Login using stored data of user in database
- Once User logged in, and relaunched the app, User will redirect on the User list screen.
- Create Two tabs : 1) User List 2) Friend List
- Use randomuser api to get users' lists.
- Add swipe to refresh and pagination in user list.
- Show progress during API calls and user interaction must not be blocked. Keep separate progress bar for first time loading, pull to refresh and pagination.
- Provide an option to mark/unmark users as a friend in all the lists.
- Show details screen on click of user's profile picture.
- The friends list shows users which are marked as a friend from the users list.
- Friends list should remain the same on relaunch of app.
- Show details screen on click of user's profile picture.

API details:

<https://randomuser.me/api?results=10&page=1>

Method: GET

Query param: results=10 page=1

You can check random user API website for all the details of API Notes:

- I would like to see the things below in code.
 1. Usage of good architecture and we'll comment on code would be a plus.
 2. Need to use Retrofit for api calling
 3. Use Kotlin Language
 4. Animation between common fields between list and details screen
 5. Code quality
